
(a) explicit scheme, all 800 design variables
n = 800
median rel. = 2.88e-07
max rel. = 1.14e-01
max err / max|∇J| = 4.9e-08
R^2 = 7.2e-15 from 1
h = 1e-04
AD and adjoint $\partial J/\partial\rho_e$
central difference $\partial J/\partial\rho_e$
(b) implicit scheme, all 800 design variables
n = 800
median rel. = 1.94e-07
max rel. = 7.32e-02
max err / max|∇J| = 2.8e-08
R^2 = 3.1e-15 from 1
h = 1e-04
AD and adjoint $\partial J/\partial\rho_e$
central difference $\partial J/\partial\rho_e$
(c) step-size study, per-cell derivatives
explicit (median over probe cells)
implicit (median over probe cells)
$\mathcal{O}(\varepsilon/h)$ round-off error
$\mathcal{O}(h^2)$ truncation error
relative error vs the AD gradient
finite-difference step h
